AUTOMOTIVE**

1. Oil Check	Urgent	Important	Future
Check all oil levels are sufficient, including engine, power steering and auto transmission to ensure that your car is operating efficiently and preventing engine damage.			
2. Tyre Pressure			
Ensure tyre pressure is not too high or too low which could result in uneven wear and inefficient fuel consumption. Having the right tyre pressure can also prolong the life of your tyres.			
3. Condition of Tyres			
We check the tyre wear. Worn tyres can be dangerous as this affects the handling of the vehicle, especially in wet conditions.			
4. Tools and Spare Tyre			
Ensure that spare tyre is in good working order. Check that the required tools are there should you need to change tyre.			
5. Cooling System/Water Level			
The condition of the coolant is checked, if it's in poor condition it will promote/cause engine corrosion. Check water levels and hoses to ensure they're not cracked or broken.			
6. Brake Fluid - Level			
If the brake fluid level is too low it is usually caused by a "leak" in the braking system and it might be as a result of the brake pads being worn.			
7. Check Light bulbs			
Test to see if all lights are working. Especially rear lights, as it's usually difficult to know if they are out.
